# **HydroBio**® **Biofilm Test Kit**

Biofilm forms when bacteria attach to surfaces exposed to water, and begin to excrete a slimy, glue-like substance. This matrix then feeds and protects bacteria against the action of biocides. Only a good and complete tailor-made water treatment can avoid the biofilm growth. The determination of biofilm amount in the system thanks to HydroBio® test kit enables to adapt the biocide treatment to the variable conditions and thus to control better microbiological risks, like LEGIONNAIRE'S DISEASE.

## **Applications**

You can use HydroBio test kit for biofilm determination especially in:

- » Cooling water systems
- » Process water (Food and Beverage industries, Paper Industry, etc.)
- » Membrane filtration processes

# Using instructions: Very easy and rapid

1. Place a coupon in the rack inside the water system during a defined time (consult your local representative).

2. Place the coupon for 2 minutes into the washing solution

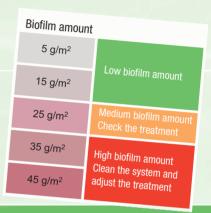

3. Place the coupon for 15 minutes into the colouring solution

4. Place the coupon for 2 minutes into the washing solution

**5.** Compare the coloured coupon with the graduation

# What will **HydroBio**® bring you?

### **TECHNICAL BENEFITS**

- » To complete the monitoring of your system's water treatment and biocide treatment
- To adjust the biocide treatment avoiding microbiological growth (Ex: Legionella control) and corrosion

### COST REDUCTION

- » More optimised biocide consumption
- Less cleaning operations
- Better heat transfer and less risk of pipe plugging

### **CONVENIENCE**

A very convenient test kit, usable by operational staff. No necessity of lab facilities

### SAFETY AND REGULATION **ASPECTS**

- The must for maximum safety regarding microbiological risks
- A good way to meet the regulation requirements, regarding microbiological growth and risk accessment
